RE: Enterprise Resource Planning Project Proposal for Able Sisters Bakery

Dear Able Sisters Bakery,
On behalf of AKNE Consulting, we are pleased to submit the enclosed proposal for the Enterprise Resource Planning Project for Able Sisters Bakery.

The primary purpose of this report is to address the operational challenges currently facing the bakery. Our proposed ERP system — built around QuickBooks Online for financial management and inventory, and Salesforce Essentials for customer relationship management — aims to modernize bakery operations, reduce ingredient waste, and improve financial tracking, ultimately helping the bakery gain a competitive edge in the market. The proposed solution falls within the expected $15,000 budget and covers all relevant infrastructure required to ensure the project's success.
We welcome any questions regarding this report and are happy to discuss further at your convenience.

Your consideration of our proposal is greatly appreciated. We hope this report meets with your approval and look forward to working with you to help Able Sisters Bakery thrive in the years ahead.

Sincerely,

Hoang Phuong Anh Ho

Information Systems Solution Strategy Proposal for Able Sisters Bakery

Executive Summary

Able Sisters Bakery is a family-owned business that specializes in organic high-quality baked goods like breads and custom cakes. The bakery serves luxury hotels and restaurants, which make up most of its revenue, and has a small retail shop. While they are successful, the bakery faces challenges like ingredient waste, outdated systems, and difficulty managing customer relationships. These numerous problems limit the ability of the company to grow and compete effectively in the market.

To solve these issues, this report recommends implementing two systems: QuickBooks Online and Salesforce Essentials. QuickBooks will help manage finances, track inventory, and reduce waste, which is currently a significant cost for the business. Salesforce will centralize customer data, automate loyalty programs, and provide tools for targeted marketing, helping improve customer retention and sales.

Both systems meet the bakery's goals by solving current problems and preparing for future growth. They fit within the $15,000 budget, are easy for employees to use, and can scale as the business expands. Furthermore, the company will have leftover money in which they will be able to utilize targeted marketing, which will hopefully allow them to bring in more loyal customers. With these tools, Able Sisters Bakery can streamline operations, better serve its customers, and create opportunities for long-term success.

Current Company Status

Able Sisters Bakery is a company founded in 1997 that is currently run by three sisters, Sabel, LaBelle, and Mabel. They offer custom cakes as well as specialty breads to their customers. In the past, the company's main side of the business was through their contracts with high-end hotels and restaurants; however, recently they have begun their small retail operation. The ingredients that the company uses are high-quality and are primarily from local suppliers.

The commercial side of the business accounts for approximately 95 percent of the company's revenue, which shows how established they are in that industry. With these sales, they have developed stronger partnerships with many companies which positions them as a trusted supplier of baked goods to higher-end establishments. With the amount of commercial success the company is having, they have attempted to become more independent, by increasing the amount of sales that occur within their retail location. The benefit of having more dependency on the retail location is that they are diversifying their sales, and if something were to happen in the commercial side of their operations, they would still have their retail operation to generate revenue. Switching to a greater retail presence also means that the company will have greater opportunity through engaging with their customers, and fostering better relationships with customers, which will ultimately lead to a greater market presence.

The company currently faces numerous challenges, with its physical location being a larger one. The current retail location is located near a river, and in the past, has flooded, which has disrupted their operations. These flooding disruptions can cause complications with inventory, leading to inventory waste, and can also halt operations, causing losses for the company. To protect themselves from bad weather, as well as

create a better atmosphere for their retail customers, the company should look at a larger location that is not prone to flooding.

Although the company may not have the ideal location to sustain a retail business, they have fostered great connections with people in the industry, as well as its customers. Because of this, if the company were to change locations or even expand and open up new locations, it would have the network and customer base to succeed. Recently, there has been an increase in competition within the local retail bakery competition; however, all of the sisters are devoted to the company and will work their hardest for the company to succeed in the long run.

Overall, the bakery has a strong foundation to excel in the retail bakery industry. They have strong connections in the baking industry and will be able to use these connections to further their presence in the retail environment. Furthermore, by relocating to a more suitable location, or expanding and opening more locations, they can capitalize on different communities. With good investments in management software, the company will be able to excel with the foundation that they have already established.

Company Culture and Competitive Analysis

Each of the sisters has their specialization within the company, with Mabel, attending business school to become an entrepreneur. Sabel is an established chef and baker, who attended culinary school. Lastly, Labelle is strong with conflict resolution as well as dealing with people, and she studied sociology and psychology.

Due to each of their strengths, they each have their own defined role that they excel in. Mabel, who studied business, is the CEO and typically spends her time doing office work and meeting with larger clients and other individuals. Sabel, who has a culinary background, does all of her work in the bakery area and focuses solely on baking operations. Labelle is the operations manager, who spends most of her time behind the counter and converses with employees and customers, ensuring everything is being done correctly.

With the strong leadership structure within the company, it allows each individual to excel in their area of talent, and grow their teams while sharing their expertise with their employees. Looking at each sister from a business perspective, Mabel will be able to provide strategic insight on the company which allows the company to have a strong financial plan, and good future planning when the company plans on scaling. Sabel's culinary skills will ensure that the company maintains its high-quality product, and will help the company innovate and create new, unique bakery items that will drive new customers into the bakery. LaBelle's people skills will allow the work environment to stay fun, yet efficient, keeping employees happy while also ensuring that work is being done to a high standard, at an effective rate. Furthermore, she will ensure customer satisfaction by interacting with customers and collecting feedback on how to improve, which can later be communicated with the other sisters to discuss areas for improvement.

The Able Sister's culture is also known for its focus on sustainability and supporting its community, as it sources all of its ingredients locally. While this ensures high-quality, fresh products, showing support for their local community will drive other local companies to use them as a source of baked goods. This is an advantage they have over many competitors, who may be large chain restaurants that source from the cheapest supplier, likely overseas. Therefore, their persistence to use local sources is a major appeal for the Able Sisters Bakery.

When looking at the competition for the Able Sisters, a typical recipe for success for retail bakeries is having a location that sees a lot of foot traffic, as it allows for the consumers to walk past possibly during their lunch or coffee break, pick up some baked goods and a beverage, then continue work. There is no indication that Able Sister's current location is in a good location, so if the company were to expand or switch locations, it would ideally find a location with a high population density, possibly by working office buildings.

Requirement and Needs Analysis

Currently, 95% of the company's revenue comes from the commercial side of the business, with only 5% being from their retail location. One reason for the lack of retail sales for the company is because of their physical location. Their one location consists of a large bakery section, an area for food storage, a small office, and a little counter area which they use for shipping and receiving. The location is a problem due to its location near a river, which causes flooding for the company, halting business operations. In a year with persistent bad weather, it would cause potentially catastrophic results for their business.

To address the challenge in regards to the location, the company should strategically relocate to a location that has heavy foot traffic. This would improve the amount of walk-in customers they receive, who could potentially turn into long-term customers. Additionally, a new location should have more retail area, as the current spot has a lack of area, and isn't optimized for a retail location. With a better facility in a location with a higher population density, the bakery would have better appeal to potential customers, and they would be able to operate more smoothly and organized with the additional workspace.

Implementing a loyalty program is another need for the company, as it could benefit their retail sales, as well as the ability to retain their customers. By incentivizing their customers through various efforts, including discounts, free products, or offers for repeat purchases, it encourages customers to return to the store, boosting overall sales. Furthermore, loyalty programs can provide good customer data, as you can collect information on each customer, and use that information to tailor their marketing, making their marketing efforts more effective per dollar spent. An example of this is if a lemon cupcake is a top product purchased by a loyalty program member, the bakery can recognize this and highlight that product in promotions to further boost sales.

There are a few methods of a loyalty program that the bakery can employ, one being a points system. This could be done through a mobile application and can give customers a certain amount of points per dollar spent at the bakery. So, for example, every dollar spent at the bakery could give a loyalty program customer one point on their account, and once a customer reaches 50 points, they can redeem those points for a certain item. Another option for a loyalty program would be a stamp system. An example of this would be every coffee purchased at the bakery would give the customer a stamp, and once a customer reaches 5 stamps, they can redeem a free coffee. Both

programs would incentivize customers to return to the bakery and would provide valuable information on customer tendencies at the same time.

If the company wants to grow, they will also have to boost their marketing efforts. The company needs better marketing strategies to bring customers in. The Able Sisters should have someone specialized in social media marketing to begin their marketing campaign and professionally launch their social media. Using customer information they may collect from their loyalty programs, they could also implement targeted marketing campaigns, which would be launched at customers most likely to be interested in their offerings. Another possibility would be adding a system that that would allow customers to order over the phone or an app and be able to quickly drop into the bakery to collect their baked goods or beverages. These changes would allow the bakery to reach a greater audience, while also providing an easier method to order from the bakery.

Another goal that the bakery wants to achieve is reducing its food waste. Currently, with how the baking stations are being run, there is plenty of food waste that occurs, which is not sustainable, and reduces the potential profits of the company. By implementing an inventory management system, it would allow for the company to know what resources they have on hand at all times, and when they are running low. It would also allow them to track when products are going to spoil, which would reduce food waste, as well as allocate their resources more efficiently. If they were able to data regarding their stock levels, they would have a better understanding of how much product they use and would be able to reduce the amount they stock, which would help reach their goal and provide cost savings and less waste.

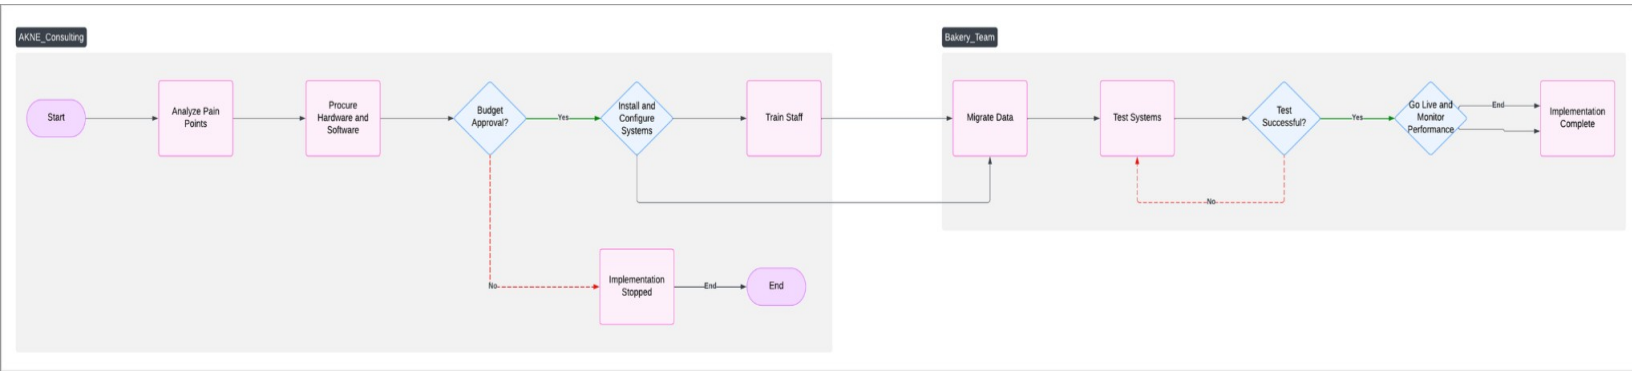

A requirement for the company is increased automation in their financial reporting, as the current financials are all on Microsoft Excel. While Raymond is going through the financial information of the company, they may make some human error, which is why it is vital for an automated process that will provide accurate data. Automated financial reporting could integrate well with inventory management as it could show what products and ingredients have good margins, and the Able Sisters can use that information to optimize their ingredient use as well as prices.

Having a strong customer relationship management strategy is also a need for the company, as it will provide them with valuable information regarding their customers. Having a customer relationship management system will allow for the bakery to have

better communication with their customers and help manage orders better from the commercial side of the business. The system should be able to track their order and customer interactions and be able to integrate with its inventory management system to ensure that the company will be able to meet the customer's demand and ensure satisfied customers. Having an overall enterprise resource planning system is exactly what the company would need.

The company could also use a centralized data point which can be accessed through the cloud. In the current situation, a lot of valuable company data can be easily lost. An example of this is Sabel’s recipes, which are written on paper cards and could be easily lost. Additionally, inventory records are also written on paper cards, which poses a risk of being lost. A centralized data point would ensure that all company information is secure, and accessible at all times, allowing the sisters to be able to access all valuable company information at once.

Business Process Diagrams

Systems Solutions

This section will identify and evaluate potential systems that will be beneficial for Able Sisters Bakery's term goals. The bakery requires a system that is capable of optimizing the aforementioned challenges, which include waste of resources, lack of a loyalty program, customer retention as well as accurate and automated financial reporting.

Information System Overview

The Able Sisters have numerous challenges within their business, and there are plenty of systems that will aid them in optimizing their company. Choosing the correct systems to implement within their budget will help streamline operations and make the business process easier for all parties, while also building a larger and more loyal customer base.

An inventory management system is one system that would greatly benefit the bakery, as one of the major issues stated in the case study is food waste at each station of the baking area. Having an inventory management system would allow the bakery to overlook the stock levels in real-time, and they would have a good understanding of when perishable products would go bad. This is important for the bakery as it would prevent certain baking areas from being overstocked, and would heavily reduce the amount of food waste that they are seeing. In addition to saving the company money from fewer products being used, it would also automate inventory tracking, meaning it would free up a large amount of time that an employee would have otherwise spent looking over stock.

Another critical system that the bakery could look into would be a customer relationship management system, which would help the company build better relationships with the customer base. Using this system, the bakery could track better data on their customers, including purchase preferences, and could help with the bakery’s promotion efforts. A strong customer relationship management system could find which products customers are enjoying and even show by the time of the year, which could help the

bakery with their marketing efforts, allowing them to know which of their items will be favored during different times of the year. Furthermore, the introduction of a customer relationship management system could strengthen their partnerships with their commercial clients, as it can help streamline their orders which is key in having repeat customers.

The company also needs to update its financial management system, as currently using only Excel manually is very prone to human error and is fairly time-consuming. A strong financial management system would automate many of the accounting tasks, and provide accurate data promptly. A strong system would also be able to integrate with inventory systems and provide valuable data regarding the cost breakdown of certain areas, which would allow the bakery to identify areas where they can reduce costs or even prioritize more spending. Overall, implementing a financial management system would have a great benefit in optimizing their accounting processes, as well as finding ways to save money in areas where they don't need excess spending.

The last system that the company could look into would be a centralized data hub. Currently, how the company manages its data poses a significant risk, as a lot of valuable data, including the recipes for their products, are stored on physical paper, which could be easily lost if a fire were to happen, or even a small accident like a water leak in the building. Having a server where all of the company's software and data are accessible would provide a safe, secure solution. The sisters wouldn't have to worry about trying to find their inventory records or looking for a certain recipe written on a card, as everything could be in a file within the server. It would also be beneficial for the hub to be backed up by the cloud, or even have a backup server at a different location, in case of an emergency, where the server at the bakery could be destroyed in the event of a fire.

A point-of-sale system could also be beneficial for the Able Sisters in improving their customer experience, and it would also mesh well with some of the other systems, including inventory management, and customer relationship management. By having all sales through a point-of-sale system, the company could be provided with inventory tracking, and also analysis on which items are doing well. This system will become even more effective the more Able Sisters scale, as it will provide an efficient solution for their retail operations.

Although numerous systems would benefit the company, to maintain within budget we will have to do further research and narrow the options down.

Research on Specific System

The three top solutions that we evaluated are an enterprise resource planning system, a customer relationship management system, and a point-of-sale system. These three systems best meet the needs of the Able Sisters, and will provide the greatest positive impact based on the budget given. For customer relationship management, we have decided to further research Salesforce Essentials, for enterprise resource planning, we are looking further into QuickBooks Online, and we are looking into Square as a potential point-of-sale system for the bakery.

Salesforce Essentials is a customer relationship management system that is beneficial for small businesses in managing their customers, tracking their sales as well as specializing their marketing efforts. The software is cloud-based, meaning that it is performed over the Internet, allowing members of the Able Sisters bakery team to access the system from anywhere as long as they have an Internet connection. The software is a central location for customer data and can provide valuable data regarding the purchasing trends of their customers. Because of this, Salesforce will be a valuable asset to Able Sisters as this data will be instrumental in implementing their loyalty program. Salesforce is also a very versatile software, and it can easily integrate with many other systems.

Although Salesforce has strong customer relationship management capabilities, it struggles with some of the needs of the Able Sisters, which includes inventory management. To be fully functional for the Able Sisters's needs, it would likely need to be paired with another software, which may be difficult given the budget we have been given by the Able Sisters.

As the Able Sisters want to expand looking ahead to the future, Salesforce would be a good option due to its scalability and ability to handle higher usages which will come when the company grows. For pricing, Salesforce is only $35 per user per month, making it a very cost-effective solution for the problems that the Able Sisters are finding.

QuickBooks Online is an enterprise resource planning system that aids in financial management processes for small businesses. QuickBooks will be able to provide solutions to the Able Sisters for areas including payroll, invoicing, and expenses. It is a pretty simple system to use, meaning there won't be too much money spent on training for employees. It is also a very customizable system, offering its user reports catered to what they want. When used with an inventory management system, it could help with cost tracking and identify areas within the company where more savings could be found.

Although QuickBooks does have many capabilities, it will not help the Able Sisters with their customer relationship management, or loyalty program. The system is pretty cheap though, with it currently being approximately $30 per month. QuickBooks would be beneficial for the company as it would automate many of the financial processes that are currently being done manually, meaning their financial information will be done faster, more accurately, and stored more safely.

Lastly, Square is a point-of-sale system that excels in the restaurant industry, as it provides tools for sales and inventory management. Square can provide inventory updates, as well as alerts when stock is low, which will be beneficial in mitigating food waste. Square is also a strong option for a loyalty program, as it can quickly bring up customer information and reward repeat customers. Furthermore, Square offers in-depth analysis on sales analytics, which can show trends in purchases, and what products are best selling at which times.

Square consists of hardware options, which include card readers, which can make the ordering time more efficient, meaning a more enjoyable experience for the customer. Square has a register kit which can be purchased for $1,300, and once purchased the system can be used for $60 per month.

Recommendation

After doing research into each system, we have decided that implementing QuickBooks online as an enterprise resource planning system, and Salesforce Essentials as a

customer relationship management system simultaneously would be the best course of action for the Able Sisters. QuickBooks would be beneficial for financial management, as well as inventory tracking, which would support the Able Sisters' goals of a better financial management system, as well as a reduction of food waste. Additionally, Salesforce will be able to better retain customers, and implement an effective loyalty program, due to its customer relationship management capabilities.

Together, these systems will be able to centralize important data, provide insights on sales and customer behavior, and optimize work processes, ultimately leading to smoother operations business-wide. The systems are both cloud-based and will fit within the given budget of the company. Lastly, both systems are scalable and will be able to keep up with the demands of the company as they expand and grow.

Implementation Plan

Ables Sisters Bakery in cooperation with our AKNE Consulting, plans on implementing QuickBooks as its personal ERP of choice, and Salesforce as its CRM. Implementing an ERP like QuickBooks will not only help the bakery simplify its financial management but it will also greatly improve its inventory management system by providing real-time inventory updates to their ingredient levels, ingredient costs, and ingredient usage. This will solve the bakery’s waste management problem as well. As for implementing a CRM, a Salesforce system will help the sisters centralize their customers' data, automate each phase of their bakery’s sale process as well as their marketing process, and provide key analytics on customers allowing for a more personalized experience.

IT Infrastructure

The first step in implementing QuickBooks and Salesforce is to determine the bakery’s pain points. This means we should analyze and determine why they need a new ERM

and CRM system implemented. The Able Sisters Bakery has multiple pain points currently that need to be addressed, they have poor financial management, inventory, and waste issues, lack of customer personalization and engagement, and outdated technology. With these pain points in mind, our company suggests the implementation of QuickBooks and Salesforce.

Hardware Requirements

The first step our company will take is determining if the bakery has the proper hardware requirements. Currently, the bakery has several Windows 7 desktops. These desktops are outdated and will need an upgrade. The current hardware requirements for the fastest and most stable experience for the implementation of the Salesforce CRM are a Windows 10 or 11 computer that has; at least 8GB of RAM, 3 GB needed for Salesforce browser tabs, an internet connection that has a download speed of 3 MBps or greater, network latency of 150 ms or less, and an Octane 2.0 score of 30,000 or greater. With this in mind, we will first replace the bakery's several Windows 7 computers with new Windows 11 computers.

The new computers will need to be laptops as Mabel wants more portability we will be purchasing 4 new HP laptops at $430 each. The next hardware purchase that the bakery will be making is a new POS for the retail counter based on Mabel's needs. The company has decided to implement a Square POS system, this POS system integrates well with Salesforce and QuickBooks and fits within the budget requirements. The Square POS system (register, and terminal) will cost $1300 initially and $60 per month for their Square Plus subscription.

The last IT infrastructure step will be determining if The Able Sister's Bakery has optimal internet for this implementation. Currently, the bakery is networked together in a wired ethernet network all sharing a single low-speed wired connection. As these systems require fast internet the bakery will need an upgrade. For the bakery's internet upgrade, we will be using TELUS's Fiber Internet 1.5G + Wi-Fi business plan. This plan easily meets the internet speed needs and costs $125 per month for 36 months. For the hardware implementation time, we approximate one week for hardware delivery and 2-3 for installation.

Software Requirements

With the business pain points and needs in mind we have recommended a Salesforce system as well as a QuickBooks system. A Salesforce system (Startersuite) would cost the bakery CAD 35 per month billed annually. For the QuickBooks system, we have opted for the Essentials plan which costs $54 per month. This means for access to these systems will cost the company $89 per month in licensing fees.

Budget

Item	Quantity	Price	Training	Total Cost
HP Laptops	4	$430	N/A	$1,720
Telus Internet Setup	1	$- Monthly	N/A	$0
Square POS (Register Kit)	1	$1,539	Square	$1,300
Capital Costs				**3,020**

Ongoing Costs

Item	Monthly Cost	Training	Annual Cost
Salesforce CRM	$35		$420
QuickBooks ERP	$28.50 (first 6 months), $105 after		$801.60 for the first year, $1,260 after
Telus's Fiber Internet 1.5G + Wi-Fi business plan	$125		$1,500
Square POS Subscription	$60		$720
Total	**$325**		**$3,900**

Total Spending after a Year: $7616

Project Implementation Plan

For this project implementation plan, our company plans on fully implementing everything in a month. Internet, hardware, and POS systems can be implemented within a week. The software however will take some time to implement.

Implementation steps:

Preparation (Week 1-2):

- Finalize Vendors: Confirm contracts for QuickBooks, Salesforce, Square POS, and Telus Internet. Align delivery timelines.

- Procure Hardware: Order 4 HP laptops, Square POS system, and necessary peripherals.
- Set Up Internet: Install Telus Fiber Internet 1.5G, verify coverage, and configure a secure network.

Installation (Week 3-4):

- QuickBooks: Install and configure for financial and inventory management.
- Salesforce: Set up CRM for customer data and sales automation.
- Square POS: Configure hardware/software for retail sales, link with QuickBooks and Salesforce.

Data Migration (Week 4-5):

- Financials: Digitize records and upload them to QuickBooks.
- Inventory: Transfer and organize stock data for real-time tracking.
- Customer Data: Consolidate and input into Salesforce for personalized marketing.

Training (Week 5):

- Develop user guides and train staff on QuickBooks, Salesforce, and Square POS.
- Conduct practical sessions based on role-specific needs.

Testing & Deployment (Week 6-7):

- Pilot Testing: Simulate operations to identify and fix issues.
- Go Live: Launch systems fully, monitor performance and gather feedback.

This streamlined plan focuses on key actions to ensure efficient implementation and staff readiness.

Conclusion

In conclusion, by resolving its fundamental operational inefficiencies and preparing it for long-term growth, the integration of Square POS, Salesforce CRM, and QuickBooks ERP will drastically change Able Sisters Bakery. Key parts of the bakery's operations that have long been hampered by manual procedures, such as financial administration, inventory monitoring, and customer involvement, will be modernized by these tools. The bakery will be able to effectively compete in the changing market by adopting these solutions, which will also help it minimize inefficiencies and bring it into line with current industry standards. The suggested technologies provide a strong yet affordable answer to the bakery's requirements and are easy to use, expandable, and well within the $15,000 budget.

These systems offer significant and wide-ranging advantages. Because QuickBooks ERP automates tedious activities, minimizes errors, and ensures real-time resource tracking, it will simplify financial and inventory administration. By doing this, the bakery will be able to maximize the use of ingredients, cut waste by at least 20%, and enhance overall financial management. By centralizing consumer data, Salesforce CRM will make it possible for tailored communications, focused advertising campaigns, and automatic loyalty plans. By strengthening ties with both retail and commercial clients, these features will increase customer retention rates and encourage repeat business. Furthermore, by effortlessly connecting with Salesforce and QuickBooks, the Square POS system will transform the retail counter experience by guaranteeing smooth transactions and offering insightful data on customer behavior and sales trends.

A seamless transition with no interruption to operations is guaranteed by the implementation strategy. The bakery will be able to implement these technologies gradually and successfully thanks to the staged strategy, which begins with planning and vendor finalization and continues with installation, data migration, staff training, and testing. Staff members who receive thorough training will be able to utilize these tools to their full potential and quickly become accustomed to the new processes. The performance of these solutions will be further optimized by routine post-deployment monitoring and feedback, guaranteeing that they continue to satisfy the bakery's changing needs.

This plan is a disruptive strategy that will improve financial stability, consumer engagement, and operational efficiency. It goes beyond a simple technology upgrade. Able Sisters Bakery will increase operational efficiency, cut expenses, and obtain priceless insights into the tastes and actions of its clientele by using the capabilities of QuickBooks, Salesforce, and Square POS. Additionally, these systems offer a scalable base that can accommodate the bakery's future expansion, whether it is through product diversification or retail expansion.

Thanks to its implementation, Able Sisters Bakery will eventually improve its standing in the retail and commercial industries. It demonstrates the bakery's dedication to excellence, community, and innovation, guaranteeing its survival in a market that is becoming increasingly competitive. With these resources in place, the bakery is prepared to succeed in the long run and take the lead in the market for high-end baked goods.

Appendix

Appendix A: Case Study - Ethiopian Airlines' ERP and CRM Integration

Ethiopian Airlines faced some challenges in providing quality and services to customers. To solve this, they used two systems: Enterprise Resource Planning (ERP) and Customer Relationship Management (CRM). These systems helped departments work together better and improved customer services
After combined these systems, the airline had big improvements:

- Faster processes, such as booking and customer support
- Better communicate between airline staffs and customers
- Employees spend less time on duplicate data entry

The airline also measured customer satisfaction using a technique known as the SERVQUAL framework. They found that customers were satisfied, especially with aspects like safety and reliability
The study also discusses about challenges, like:

- Lack of training for employees on how to use the systems
- Poor communication during set up
- Managers not fully committed to the project
- Concerns about keeping data safe

In conclusion, by using ERP and CRM systems, Ethiopian Airlines worked better and improved services. But the company still needs to solve some problems to get fully benefits

Appendix B: Diagram of ERP and CRM Integration

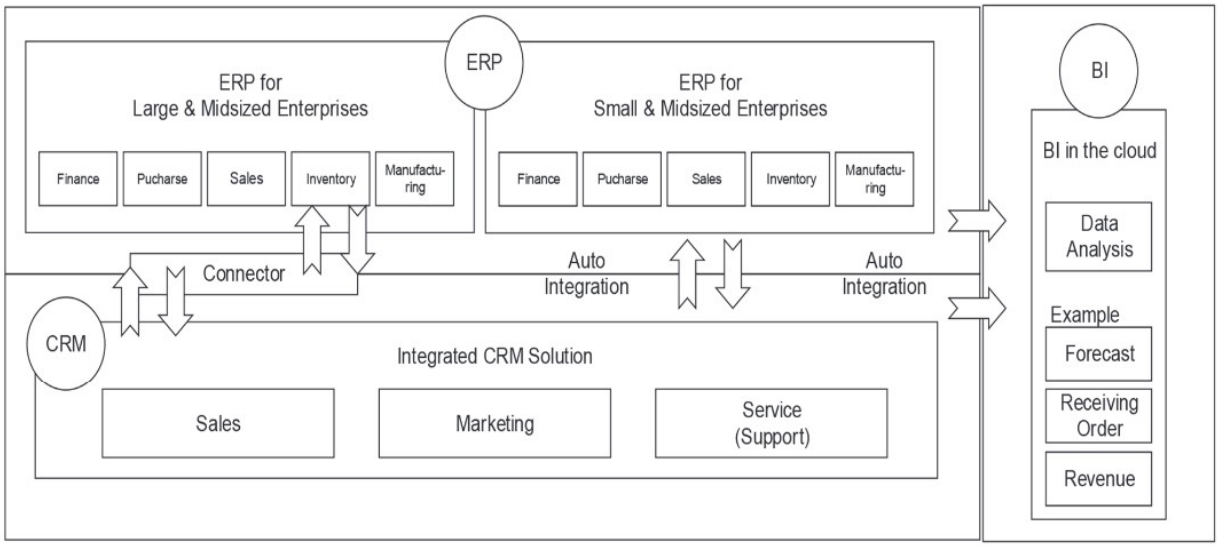

Fig. 6. Integration of ERP, CRM and Bi systems [21].

This diagram shows how ERP and CRM systems work together. By connecting these systems, information can flow smoothly between different department of the business, like sales, marketing, and inventory. This helps the company work more efficiently and provide better customer service, just like the example of Ethiopian Airlines
